UPDATED JANUARY 2002
CONSTRUCTION OF YOUR OWN LIFE CHART

THE NIMH-LIFE CHART METHOD™

(The LCM™)

Introduction

We hope that your participation in learning how to chart your own course of illness will be productive and useful and will make it easier for you and your physician to evaluate how well a medication works for you and which medications are the most effective for you in the acute and long-term management of your illness.

Starting your daily ratings now as part of your current treatment while also constructing a retrospective Life Chart of your past course of illness as your time allows, will create a Portable Psychiatric History that is available to you and your physician at all times as a comprehensive overview of the longitudinal course of your illness and its response to treatment. Additionally, this can be of substantial value should you transfer to a different treatment setting or wish to obtain a consultation regarding further treatment options.

The retrospective Patient Manual describes how to chart the past (i.e. retrospective) course of your illness and how to record prior episodes, medications, and significant life events by month and year on the Self-Rated Retrospective Life Chart Form (LCM-S/R).
This life chart manual introduces you to the current, daily (i.e. prospective) charting of your mood and functioning and provides guidelines how to use the NIMH-LCM™ Self-Rated Prospective form (LCM™- S/P) on a daily basis.

Both Manuals for ease of use are written as sections that are complete in themselves but both the prospective and retrospective Life Chart Method™ use the same life-charting techniques. The only two major differences are that retrospective life chart ratings are recorded by month and year at three levels of severity while prospective life chart ratings are done on a daily basis and at four levels of severity dividing the moderate level of severity into low moderate and high moderate. This was done because it was felt that daily ratings allowed for the plotting of finer degrees of improvement or worsening since there should be little difficulty in remembering if ratings are done on a daily basis.

Think of the life chart as a way of sketching an outline of your past and current course of illness in the form of a simple, continuous graph that can visually record manic and depressive episodes and hospitalizations you have experienced, medications you have taken, and important things that have happened in your life. We hope you will find that with life charting you can soon become a more knowledgeable participant and an active and collaborative partner in the management of this medical illness.
Daily Charting of Mood and Functioning

_Prospective Life Charting/Self Rated_

(The NIMH LCM™- S/P)

Tracking your current course of illness and sharing the information with your physician/therapist can be of great value and an important component of your routine clinical visits and any treatment decision you and your physician will make.

As you can see on the enclosed form, the NIMH-LCM™ Self Rated Prospective Form (the LCM™- S/P) uses daily ratings of mood and functioning and entry of the total number of tablets of medications taken each day for the treatment of your affective illness. Each box on the form represents one day and each form provides for ratings for one month.

The daily rating, which is done at the end of each day, will only take a minute or two and can easily be completed together with taking your evening medications. This is useful not only in tracking your daily course of illness but can also help you remember to take all your prescribed medications for the day. The daily ratings will form a continuous record that will assist you and your doctor to better evaluate and treat your illness and to make further treatment decisions that can be based on a detailed and accurate overview of your illness.
PRINCIPLES OF PROSPECTIVE LIFE CHARTING

Let's start with the basic principles and techniques of life charting as illustrated on the LCM™- S/P, the self-rated prospective (i.e. current/daily) rating form:

GRAPHING OF EPISODES:
The time line in the middle of the chart, (which also marks the Days of the Month), is called the Baseline, which indicates a level or balanced mood state, i.e. you are not depressed or hypomaniac or manic.

Episodes of depression are drawn below the baseline and episodes of hypomania or mania are drawn above the baseline at four severity levels (mild, low moderate, high moderate, or severe). Severity is based on your level of functional impairment due to depressive or manic mood symptoms in your usual social, educational, and occupational roles. Any hospitalization for mania or depression is rated at the most severe level and blackened in:
MOOD SCALE

The prospective rating form provides a mood scale (on the left lower corner of the form) to assist you in rating your daily mood with fine gradations. The scale is from 0-100 (0 = most depressed you could imagine being; 50 = balanced or level mood; 100 = most energetic/ activated/ manic you could ever be).

After you have rated your mood on this scale, you record the number you chose for the day in the row marked “Mood”. (For example, if today you felt moderately depressed you might rate your mood as 32 or 35, or if you felt mildly hypomanic, you might rate your mood as 54 or 57).

You then assess how much your mood has affected your ability to function for the day in your usual roles at home, work, school or with friends. The level of functional impairment based on mood symptoms determines episode severity as described in detail in the following section:
ASSESSING EPISODE SEVERITY

Functional impairment resulting from manic or depressive mood symptoms has been employed as an effective and more consistent way of measuring episode severity. Episode severity has been categorized at four levels prospectively and for ease of use we have precoded the levels of episode severity at the left margin of the form:
The Following Guidelines have been Established for Rating the
Four Levels of Episode Severity for the Daily Prospective Life Chart Ratings:

HYPOMANIA AND MANIA:

At the mild level of hypomania you may experience very mild symptoms such as decreased need for sleep, increased energy, some irritability or euphoria (elated, very happy mood), or an increase in the rate of thought, speech or sociability. At the mild level these symptoms have no negative impact and might even initially enhance your ability to function.

At the low moderate level of mania you have some of the above symptoms to a somewhat greater degree with some added symptoms, you may begin to be less productive and more unfocused, and you get some feedback from family, friends, or coworkers that your behavior is different from your usual self.

At the high moderate level of mania you may experience very significant symptoms such as very decreased need for sleep (or you may not sleep at all), a much increased level of energy, you may feel all powerful or out of control, your thoughts and speech may be extremely rapid and you get much feedback that your behavior is different or difficult. Friends, family, or coworkers express great concern about your ability to look after yourself or others, and others may appear angry or frustrated with your behavior.

At the highest or severe level of the manic mood state there is an even greater increase in the above symptoms with much insistence by family and friends that you need medical attention, that your behavior is out of control, or they might take you to the hospital concerned that they and you cannot keep you safe any longer.
DYSPHORIC HYPO/MANIA

Dysphoric hypomania and mania can occur as part of bipolar illness and is experienced, at times, by about 40% of patients with this illness. Increases in energy, activity, your rate of thinking and interactions, with anger and irritability in the context of decreased need for sleep are present during periods of a depressive, “unhappy”, dysphoric hypomania or mania. On the high side of the mood scale (i.e. above 50 to 100), even if the activation feels driven, unpleasant, and is accompanied by anxiety, irritability, and anger, you are not slowed down or fatigued. (Anxiety, irritability, anger and decreased sleep can also occur with agitated depression with pacing and ruminations, however, there is usually a sense of fatigue and slowness in responding.)

On days that you may experience such a dysphoric, unhappy, irritable hypomania or mania, please check the Dysphoric Mania Box above the mania section of the life chart form.

DEPRESSION:

Mild depression represents a subjective sense of distress, a low mood, some social isolation, but you continue to function with little or no functional impairment.

Low moderate depression indicates that functioning in your usual roles is more difficult due to depressive mood symptoms and requires extra time or effort (you have to push yourself to get things done).

High moderate depression indicates that functioning is very difficult and requires great extra time or great extra effort with very marked difficulty in your usual routines (one could barely scrape by).
Severe depression means that you are unable to function in any one of your usual social and occupational roles, i.e., you are unable to get out of bed, go to school or work, carry out any of your routine functions, require much extra care at home, or need to be hospitalized.

**SUMMARY SCHEMA**

**PROSPECTIVE LIFE CHARTING OF SEVERITY LEVELS: SYMPTOMS AND DEFINITIONS**

**MANIA**

<table>
<thead>
<tr>
<th>Symptoms of Mania</th>
<th>Functional Impairment</th>
<th>Episode Severity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Life or no sleep, delirious, violent, explosive, hallucinations, delusions</td>
<td>needs close supervision, has no judgment, poor, unsafe in danger, may hit/hurt others</td>
<td>Severe: much intense dysphoria that patient gets medical attention; patient unable to function in any goal-directed activity</td>
</tr>
<tr>
<td>Grandiosity, very disorganized or no sleep, reckless investments in energy and activity</td>
<td>little or no judgment, not easy to reach, inappropriate behavior, can't function at work</td>
<td>High Moderate: very significant difficulty with behavior and goal-directed activities, can't focus, not productive</td>
</tr>
<tr>
<td>Agitation, increase in energy, decrease in sleep, increased in speaking or shouting</td>
<td>poor judgment, sometimes difficult to work at home, difficulty with goal-oriented activity</td>
<td>Low Moderate: noticeable impairment, feedback about behavior; less productive, untoward</td>
</tr>
<tr>
<td>Decrease in sleep, elation, energy, more social, mildly depressed</td>
<td>little or no impairment, can be focused and productive</td>
<td>Mild: no or mild impairment; functioning possibly enhanced</td>
</tr>
</tbody>
</table>

**DEPRESSION**

<table>
<thead>
<tr>
<th>Symptoms of Depression</th>
<th>Functional Impairment</th>
<th>Episode Severity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subjective dizziness, low mood, sleep and appetite O.K.</td>
<td>Functioning well at work and at home, little or no impairment, in social integration</td>
<td>Minimal to no impairment</td>
</tr>
<tr>
<td>Decrease in sleep, apathy, decreased energy &amp; concentration, sad, tired, socially isolated</td>
<td>Some impairment at work and home, minimal day to day work, has to push self</td>
<td>Low Moderate: noticeable impairment; some extra effort needed to function in usual social and occupational roles</td>
</tr>
<tr>
<td>Reducing sleep, very low energy, suicidal, withdrawn, poor hygiene, much difficulty getting or maintaining</td>
<td>Great difficulty functioning, can't go to work, has to push self very hard</td>
<td>High Moderate: very significant impairment; great effort needed to function in any role; barely escapes by</td>
</tr>
<tr>
<td>Immobility, can't do or concentrate, rude or extremely agitated</td>
<td>Isolated in bed, maybe</td>
<td>Severe: severely impaired because of disability</td>
</tr>
</tbody>
</table>

Please note: Functional impairment due to other medical illnesses such as the flu, a broken leg, arthritis, heart disease etc., are not factored into rating episode severity.

The next two pages provide you with a list of some key words that can be helpful in assessing the four prospective levels of depressive and hypo/manic episode severity based on functional impairment.
## Sample Key Words for Levels of DEPRESSION and Associated Functional Impairment

<table>
<thead>
<tr>
<th>Types of Mood and Vegetative Symptoms</th>
<th>Severity Level</th>
<th>Functional Impairment</th>
</tr>
</thead>
<tbody>
<tr>
<td>subjective distress</td>
<td>MILD</td>
<td>• minimal or no impairment; continue to function well at work, school, and home</td>
</tr>
<tr>
<td>mild sad mood</td>
<td></td>
<td></td>

</tr>
</tbody>
</table>
YOUR OWN SYMPTOM CHECKLIST

It may also help to identify and to develop your own short list of your typical symptoms associated with depressed and manic episodes. For example, for some people the best marker of hypomania may be increased energy, for others decreased need for sleep, for others increased sociability, phone calling or spending. Likewise, for depression, some people feel slow or apathetic while others feel agitated, some sleep more while others can't sleep much, some have the feeling that their mind is blank while others are plagued with depressive thoughts. Having your own list of your typical symptoms can serve as your own Early Warning System to help you and your doctor be more aware of any signs of re-emergence of your illness. In this way you can intervene early on before symptoms get more out of control by asking your physician or, in some instances, having a preset agreement with your doctor about what medication adjustments would help prevent a full breakthrough episode. (Additionally, this list will make it easier to remember manic and depressive episodes and graph them more consistently over time when you construct your own retrospective life chart.)

If you feel comfortable sharing your key symptom list with selected people in your usual environment, such as family, friends, or a trusted co-worker, it can significantly contribute to your ability to stay well. Early warning symptoms of an impending breakthrough episode are sometimes ignored (possibly in the hope that things will get better on their own) or simply not recognized (particularly an impending manic breakthrough). Being alerted by someone with whom you have shared your checklist, so that they recognize the emergence of some of your typical depressive or manic symptoms, may help you get into treatment early on or overcome your reluctance in either the early depressive or manic phases to seek medical help.
ULTRA-ULTRA RAPID (ultradian) CYCLING:

CYCLING WITHIN A DAY

A. and B.

At times you may experience what is called very fast, “ultradian” cycling within a day by switching mood states (A) or by experiencing significant switches within the same mood state (B) as described below:

A. Cycling (switching) within a day between hypo/mania and depression:

Sudden, distinct, and large mood changes within a single day are rated as a split mood rating indicating the most energized/manic mood for the day (for example 75), and the lowest mood for the day (for example 16). This split mood rating is entered in the "mood" box (located below the depression ratings) as 75/16. Each time the mood crosses from one mood state to another (i.e., from depression to hypo/mania or from hypo/mania to depression) within one day, this is counted as one mood switch. The number of times that the mood switches from one mood to the other is entered in the "mood switches/day" box.
B: Cycling (switching) within a day within the same mood state:

Sudden, sharp and dramatic mood switches within a single day within one mood state (such as from very mild hypomania to mania and back) are also counted as a mood switch. The greatest amplitude (or range) of a sudden switch, for example, 85/54 for a switch within the manic range, (or, for instance, 41/12 for a switch within the depressive range), is recorded as a split mood rating and is entered in the "Mood" box. The number of switches is then entered in the "Mood Switches/Day" box.

(Please note that typical diurnal variation, i.e., worse in the morning and a very gradual improvement during the day [or better in the morning with a gradual worsening as the day goes on] should not be counted as a mood switch).
RECORDING FUNCTIONAL IMPAIRMENT DUE TO ULTRADIAN MOOD SWITCHES:

After counting and entering the number of mood switches per day you then rate how much your worst hypomanic and depressive symptoms of this day have affected your ability to function. Indicate the greatest functional impact of these manic and depressive switches by drawing up and down lines to the most severe impairment level reached, following the guidelines on the margin of the life chart rating form.
MEDICATIONS

Be sure to record each medication and dose in the left margin of the Medication Section. Enter the daily total number of tablets taken of each medication in the appropriate box (e.g., lithium, 300 mg, 3 tablets). This can best be done in the evening when you chart your mood and episode severity for the day, will help you track your medications, and assist you in making sure that you haven taken all your medications for the day.

MEDICATION SECTION OF THE PROSPECTIVE LIFE CHART RATINGS
SLEEP

**Hours of sleep** (rounded to the nearest whole hour) can be recorded in the appropriate box above the space allocated for manic episodes. (If you slept, for example, 4.5 hours, please round to the nearest whole hour, i.e., 5). Please count only nighttime sleep and do not include naps you might have taken several hours after you got up.

MENSES

For pre-menopausal women, menses are tracked by circling the days of the menstrual periods at the bottom of the rating form.

COMORBID SYMPTOMS

Please record any other illness symptoms you may have experienced for days or all of this month, such as anxiety, # of panic attacks, alcohol use (i.e., # drinks/day), binge eating, etc., in the space provided on the LCM™- S/P. Please indicate start and stop dates of these symptoms with arrows pointing to the date line.
LIFE EVENTS

Please record important life events you may have experienced on any of the days of the month in the life event section of the life chart.

Please rate the expected impact each key life event and possible trigger of illness on a scale from +4 (extremely positive) to 0 (neutral) to -4 (extremely negative) and enter your rating in the Impact box available for each day.

When rating the impact of the event, please consider how desirable the event was, how much you felt the event was under your control, how expected or anticipated the event was (or how unexpectedly it happened), how potentially disruptive the event could be long-term, and how much it could potentially affect or lower your self-esteem.

On the next page we have included a life event checklist that some clinicians and researchers have found to be of high impact and related to subsequent mood changes or dysregulation. These events or similar ones may make the recording of events easier.
LIFE EVENT CHECKLIST

1. Death of spouse
2. Death of close family member (including child)
3. Major financial difficulties
4. Business failure for self or important other
5. Loss of job for self or important other
6. Divorce
7. Marital separation due to discord
8. Serious illness of a child or close family member
9. Unemployment for at least one month
10. Death of close friend
11. Demotion for self or important other
12. Serious personal illness (hospitalized or at least one month off work)
13. Lawsuit
14. Increased arguments with spouse/life partner
15. Increased arguments with resident family member (not spouse); family problems
16. Separation from significant other (friend or relative)
17. Retirement of self or important other
18. Change in residence, major move
19. Close friend very ill
20. Relationship problems (not spouse)
21. Holiday
22. Vacation trip
23. Pet very sick or dies
24. Anniversaries of significant events
25. Marriage
26. Car or transportation problems
27. Birth of a child
28. Change in work conditions (for the worse); conflicts with boss or co-worker
29. Start new type of work
30. Engagement
31. Accident (i.e., car accident, injuries etc.) to self and significant other person(s)
32. Job promotion for self or significant person (spouse, life partner, friend, or relative)
**SUMMARY**

By completing your daily prospective ratings you are, in fact, creating a continuous graph with enormous benefits of generating an accurate and detailed picture of your illness and its response to treatment and relationship to stressors. This should be very helpful to you and your doctor in assessing the effectiveness of treatment and maintaining or changing it accordingly. It will not only facilitate ongoing treatment efforts but if the need for a transfer of your care or a consultation arises, prospective and retrospective life chart ratings will greatly assist in this process.

We have added a filled-out one month prospective LCM™- S/P rating sample on the next page as a summary for your overview as well as a medication chart by drug class with both the generic and trade name for your information. Whether you will use the life chart for your own personal tracking of your illness and its response to treatment or whether you are participating in a study, we wish you the very best.

# Common Psychotropic Medications

*Listed by Generic Name (Brand Name)*

## MOOD STABILIZERS

### Anticonvulsants

- Acetazolamide (Diamox)
- Carbamazepine (Tegretol)
- Felbamate (Felbatol)
- Gabapentin (Neurontin)
- Lamotrigine (Lamictal)
- Levetiracetam (Keppra)
- Phenytoin (Dilantin)
- Topiramate (Topamax)
- Tiagabine (Gabitril)
- Valproic Acid (Depakote, Valproate)
- Zonisamide (Zonegran)

### Calcium Channel Blockers

- Amlodipine (Norvasc)
- Diltiazem (Cardizem)
- Isradipine (DynaCirc, Prescal)
- Nifedipine (Adalat, Procardia)
- Nimodipine (Nimotop)
- Verapamil (Calan, Isoptin)

### Other

- Lithium Carbonate (Eskalith, Lithobid)
- Lithium Citrate (Cibalith-S)

## ANTIDEPRESSANTS

### SSRIs

- Citalopram (Celexa)
- Fluoxetine (Prozac)
- Fluvoxamine (Luvox)
- Paroxetine (Paxil)
- Sertraline (Zoloft)

### SNRIs

- Venlafaxine (Effexor)
- Nefazodone (Serzone)
- Trazodone (Desyrel)

### Dopamine Related

- Bupropion (Wellbutrin)
- Pramipexole (Mirapex)
Cyclic Compounds
Amitriptyline (Amitid, Elavil)
Amoxapine (Asendin)
Clomipramine (Anafranil)
Desipramine (Norpramin, Pertofrane)
Doxepin (Adapin, Sinequan)
Imipramine (Tofranil, Janimine)
Maprotiline (Ludiomil)
Mirtazapine (Remeron)
Nortriptyline (Aventyl, Pamelor)
Protriptyline (Vivactil)
Trimipramine (Surmontil)

MAOIs
Isocarboxazid (Marplan)
Moclobemide (Not avail. In US)
Phenelzine (Nardil)
Selegiline (Eldepryl)
Tranylcypromine (Parnate)

NEUROLEPTICS
Chlorpromazine (Thorazine)
Chlorprothixene (Taractan)
Fluphenazine (Prolithin, Permitil)
Haloperidol (Haldol)
Loxapine (Loxitane, Daloxin)
Molindone (Moban)
Perphenazine (Trilafon)
Pimozide (Orap)
Prochlorperazine (Compazine)
Thioridazine (Mellaril)
Thiothixene (Navane)
Trifluoperazine (Stelazine)

Atypical Neuroleptics
Clozapine (Clozaril)
Olanzapine (Zyprexa)
Risperidone (Risperdal)
Ziprasidone (Geodon)

ANXIOLYTICS
Alprazolam (Xanax)
Chlorazepate (Tranxene)
Chlordiazepoxide (Librium)
Clonazepam (Klonopin)
Diazepam (Valium)
Flurazepam (Dalmane)
Lorazepam (Ativan)
Oxazepam (Serax)
Temazepam (Restoril)
Butalbital (Fiortal)
Mephobarbital (Mebaral)
Secobarbital (Seconal)
Buspirone (Buspar)
Zolpidem Tartrate (Ambien)

**STIMULANTS**

d-Amphetamine (Dexedrine)
Methylphenidate (Ritalin, Concerta)
Pemoline (Cylert)
Modafinil (Provigil)
Adderall amphetamine product

**THYROID HORMONE**

T-3 Liothyronine (Cytomel)
T-4 Levothyroxine (Synthroid)

**SUPPLEMENTS**

Ginkgo Biloba
Hypericum (St. John’s Wort)
Melatonin
Piper Methysticum (Kava Kava)
S-adenosylmethionine (Sam-E)
ETHYL EPA (Laxdale)
EPA & DHA (Omega Brite)

**ALCOHOL/SUBSTANCE ABUSE**

Acamprosate (Campral)
Disulfiram (Antabuse)
Naltrexone (ReVia)
Buprenorphine (Temgesic, Buprenex)
Methadone (Dolophine, Methadose)

**WEIGHT TREATMENTS**

Megestrol Acetate (Megace)
Fenfluramine (Pondium)
Phentermine (Obermine, Phentrol)
Sibutramine (Meridia)
ANTIPARKINSONIAN

- Atropine Sulfate (Atropine)
- Benztropine (Cogentin)
- Trihexyphenidyl (Artane)
- Amantadine (Symmetrel)
- Carbidopa (Sinemet)
- Procyclidine (Kemadrin)
