

## **Root Canal Therapy**

A temporary filling will be used to seal your tooth until a permanent restoration is placed.

During a root canal, the nerve and blood supply to the tooth is removed which weakens the tooth and makes it more prone to fracture. It is essential that you return to your dentist for this permanent crown procedure as soon as possible.

It is possible to experience sensitivity, swelling or pain following your root canal treatment.

It is difficult to predict which symptoms, if any, you may experience and to what extent. In severe cases, pain medication may be necessary. If you experience swelling, call our office so we can prescribe the correct medication for you.
